

Can multimode fiber be used for FTTH

Overview

Multimode cables are considered to be the “domestic” fiber as they are used for local-area network, as an example, they can be used in FTTH. A fiber cable is a bundle of anywhere from 1 to 2,304 individual fiber strands encased in various protective. Multimode optical fiber is a type of optical fiber mostly used for communication over short distances, such as within a building or on a campus. Multimode links can be used for data rates up to 800 Gbit/s. Multimode fiber has a fairly large core diameter that enables multiple light modes to be. Single mode fiber, short as SMF, is a fiber cable that only allows one mode of light to transmit. Typically, this fiber includes a small light-carrying core of about 9μm diameter. These feature a small modal dispersion for vast-distance signal transmission. Although they can do the same job in some instances, the different construction methods make each of them better suited to certain tasks and budgets.
