

Coated optical fiber cable steel wire

Overview

The SWA design incorporates steel wire armoring between the inner sheath and outer jacket of the fiber optic cable. This robust structure offers physical protection against crushing, impact, and rodent attacks, making it ideal for direct burial fiber optic cable applications. Reinforcing elements in optical cables are used to withstand the axial stresses due to the laying, the working conditions or to the thermal variations, thus preventing that the same are passed on to the fibres. It is widely used in environments where durability and resilience against external forces are. EAA (Ethylene Acrylic Acid) coated steel wire have been specially developed for the Fiber to the home (FTTX) cables, it has memory free Steel Wire with very low bend radius and good adhesion to all types of jacket material. Metal Coated fiber cables for aggressive environmental conditions. Fiber optic cables for broad range InfraRed spectroscopy protected by high throughput metal coating that makes them resistant to temperature, chemical corrosion and mechanical bending strenths.
