

Core Switch Port Mapping

Overview

Network Configuration Manager provides the 'Switch Port Mapper' tool that helps network administrators identify the list of devices connected to each port of the managed switch. This eliminates the need for manually tracing the network cables. Do you have a rack of ethernet network switches with cables leading to who knows where?

Do you need to discover and identify the network. My first choice is SolarWinds® User Device Tracker (UDT), which includes a high-quality switch port mapper and easily integrates with broader monitoring tools to give you comprehensive insights into your network. For every connected port, the port mapper lists the MAC address, IP address and host names of the computers associated with that port. Switch Miner is a free lightweight open source utility for Windows that acts as a switch port mapper/switch port discovery tool.
