

Data Center Cold Aisle Liquid Cooling

Overview

Liquid cooling—specifically Direct-to-Chip (D2C) or Cold Plate technology—has emerged as the standard solution for heat rejection in modern data centers. However, shifting from air to fluid introduces complex challenges in hydraulics, water chemistry, and leak prevention. Most vendors are unveiling product roadmaps that include hybrid (liquid-air). Enterprises are adopting high-performance computing (HPC) for artificial intelligence (AI) and machine learning (ML) model training and inference, causing a fast rise in chip, server, and rack densities, power consumption, and heat levels. Data center cooling is now a first-order design constraint, not an afterthought, as AI, hyperscale cloud, and semiconductor workloads drive higher power densities. Effective data center thermal management combines airflow strategies, such as hot aisle/cold aisle and containment strategies, with. There are four base design options for liquid cooling to consider: traditional hot/cold aisle containment, rear-door heat exchangers, direct-to-chip cooling and immersion cooling. The latter three options outperform traditional air-cooling systems, which may be insufficient for cooling the.
