

# Fiber Optic Cable and Communication Major

## Overview

Optical fiber is used by telecommunications companies to transmit telephone signals, Internet communication and cable television signals. It is also used in other industries, including medical, defense, government, industrial and commercial. In addition to serving the purposes of telecommunications, it is used as light guides, for imaging tools, lasers, hydrophones for seismic waves, SONAR. Overview Fiber-optic communication is a form of communication from one place to another by sending pulses of light through an optical fiber. The light is a form of electromagnetic radiation. First developed in the 1970s, fiber-optics have revolutionized the industry and have played a major role in the advent of the information age. Because of its advantages over electrical transmission, optical fiber is widely used. In 1880, Alexander Graham Bell and his assistant created a very early precursor to fiber-optic communications, the photophone, at Bell's newly established laboratory in Washington, D.C.
