

Grounding trips the main distribution box

Overview

26 mm² (10 AWG) ground wire must be used, and in all other markets a 6 mm² must be used. Safety of Personnel: By safely channeling fault currents into the ground, proper grounding helps to reduce the risk of electric shock to personnel. This helps to reduce the potential difference that exists between conductive parts and the earth. Each DISTRIBUTION BOX and controller must be grounded. The voltage, system arrangement, loads connected, and continuity of. By unchecking the relay box, one relies on the home wiring to supply the bonded ground and by then unplugging the MP2 from the home ac opens up the possibility of dangerous shock by an ungrounded system (which has been so emphasized for boat and off-grid folks). Whether you're a seasoned pro or just starting out, this comprehensive guide will give you practical. In modern power systems, distribution boxes are the core equipment for power distribution and control, and their stable operation is crucial to ensuring the safety and reliability of power supply.
