

How many core fibers are appropriate for one pigtail fiber

Overview

The most common fiber pigtails have one fiber count, such as the simplex LC pigtail consists of one bare fiber with one terminated LC connector. The total number of cores for a 1pc fiber patch cable is calculated as the number of branches multiplied by the number of cores per branch (if there are no branches, the number of branches = 1). The connector end can be linked directly to network equipment, while the exposed end can be spliced to another fiber optic cable. For example, according to the fiber type, they can be divided into single-mode fiber optic pigtails and multi-mode fiber optic pigtails; according to the connector type, they can be divided into SC, LC, FC, ST and other pigtails; according to the number of cores, there are single-core, dual-core. A fiber pigtail is typically a fiber optic cable with one end factory pre-terminated fiber connector and the other exposed fiber. It is usually suitable for field termination using a mechanical or fusion splicer.
