

How to connect the optical cable in a fiber optic polishing machine

Overview

The typical process involves stripping the fiber coating, inserting and securing the fiber in a ferrule with adhesive, and then polishing the end using a series of films with progressively finer grits. Finally, the endface quality is checked, for example with a fiber . When polishing a fiber optic connector, by polishing machine, there are procedures and setting parameters designed to leverage the machines best practices as well as previous developments and experience. This article explains the process of optical fiber polishing, which is crucial for preparing high-quality fiber endfaces for applications like fiber connectors and fiber splices. It discusses the cases where polishing is superior to cleaving of fibers, for example, for achieving precise end angles. They are essential for connecting optical fibers to various devices, enabling the transfer of data at high speeds with minimal loss. Properly polished ends reduce signal loss and improve the overall performance of the fiber optic network.
