

How to find the power source for fiber optic cables

Overview

When measuring fiber optic power with a power meter, attach the meter to the cable. The test conditions should be similar to how the actual cable plant will be used when communications equipment is connected (see drawing below). Select the correct wavelength and set your reference. Consistent procedures ensure accuracy. Splitters, fusion splices, connectors and. Basically, there are three methods commonly performed for optical fiber testing: visible light source, power meter and light source (one jumper method), and optical time domain reflectometer (OTDR). Since fiber optic transmissions typically operate in the infrared spectrum (invisible to the naked eye), visible light sources such as visual fault finders or visible fault locators can be used to.
