

Introduction to Distribution Network Automation Terminals

Overview

A Distribution Automation Terminal is a specialized device installed within electrical distribution networks. It acts as a control point that gathers data from sensors and other devices, processes this information, and executes commands to regulate the flow of electricity. In-depth Analysis of Intelligent Solutions for the Distribution Automation Industry: Network Equipment Selection and Deployment Strategies

Distribution automation is a critical component in constructing new-type power systems, with its level of intelligence directly impacting the reliability. Distribution Automation Terminals (DATs) are transforming how electrical distribution networks operate. In this method, redundant lines are calculated by establishing knowledge graph of distribution network, and the automation terminal of distribution network is rationally. This White Paper, “Smart Grid for Distribution Systems” addresses the benefits and challenges of implementing the many different Distribution Automation functions. Distribution systems have traditionally not involved much automation.
