

Is the primary panel the electrical distribution box

Overview

From the transformer's low-voltage side (0.4kV), power is distributed to a main distribution panel (primary distribution box). They work together to keep your lights, appliances, and machines running safely. In this article, we'll explain what each panel does, how they are different, and when you need them. From there, it is routed to individual building distribution boxes (secondary distribution boxes), which subsequently supply power to unit-level distribution boxes. MAIN PANEL: Main panels are the first step in getting electricity into a building and also protect against overloads and short circuits in electrical equipment. Each circuit is protected by its own circuit breaker. You will typically find panelboards in residential, commercial, and light industrial settings, often flush-mounted on. Primary distribution systems consist of feeders that deliver power from distribution substations to distribution transformers.
