

Looking at the layer above the access layer switch

Overview

Access layer: Grant the user access to network applications and functions.

Distribution layer: Aggregates the access layer switches wiring closets, floors, or other physical domain by leveraging module or Layer 3 switches. In this layer, the layer 2 switches are installed to distribute the data packets to the addressed group of access devices. The layer 2 switches collect the data from core switches, identify the type. In layer 3 access does this mean that the user vlans are configured on all the access switches instead and the uplinks to the distro layer are all L3 interfaces?

If this is the case then what are the distribution switches doing?

Instead of using 802. It typically sits at the access layer, provides high port density, often delivers PoE, and forwards traffic. In a typical enterprise network architecture, the access layer switch is the first point of contact between end-user devices and the rest of the network.

Layer 2 Switch

Layer 2 Switch is a form of Ethernet switch that switches packets by looking at their physical addresses (MAC addresses). These switches operate at the data-link layer (or layer 2) of
