

Maximum transmission distance of SFP optical module

Overview

Long-distance variants, typically referred to as LX, EX, ZX, or ER/LR SFPs, are engineered with higher optical power budgets and longer wavelength lasers (e., 1310nm, 1550nm), enabling transmission distances from 10 km up to 80 km or more over single-mode fiber (SMF). An SFP (Small Form-factor Pluggable) module transmits data over fiber using specific wavelengths and power levels, which directly influence how far the signal can travel before degradation occurs. 1310nm: For single-mode SFP, suitable for medium-distance transmission. CWDM/DWDM modules use specific wavelengths (e. Single-mode SFP optical modules typically use wavelengths of 1310nm or 1550nm, paired with 9/125um single-mode fiber, supporting. For standard 10G optical modules, limited link budget and dispersion tolerance usually restrict transmission distance to 80km or less. To exceed 120km, traditional solutions rely on EDFA optical amplifiers or dispersion compensation modules. SFP modules support a variety of data rates, and the distance capabilities can vary based on the module's design and the type of optical.
