

Network rack temperature

Overview

Maintaining 68°F–77°F (20°C–25°C) minimizes overheating risks while balancing cooling expenses. ASHRAE recommends this range for modern servers, though some operators push to 80°F (27°C) for energy savings. Environmental standards are provided for rack level monitoring, ambient monitoring and water leak detection. Depending on size of the room: close to the door, center of room, center of racks and furthest point. Server rack temperature directly affects hardware reliability, energy efficiency, and operational costs. 2 °C increase in ambient temperature yields a -17. In other words, there's a clear correlation between data center temperature and rack equipment temperature. When, exactly, does this become a problem?

It varies by the equipment, but most CPUs are at risk. Recommended environment: 20–24 °C and 45%–55% RH; in servers, inlet 18–27 °C according to ASHRAE.
