

# ODF frame optical cable correspondence

## Overview

An Optical Distribution Frame (ODF) is a dedicated unit designed to organize, terminate, and interconnect fiber optic cables. It brings together fiber splicing, patching, and cable routing in a single structure, while shielding sensitive connectors and splices from mechanical. An ODF is a centralized platform designed for terminating, cross-connecting, and managing optical fibers. It ensures fiber management is structured, minimizes signal loss, and provides accessibility for maintenance and future expansion. Mainly used in the junction point between the optical transport networks and the optical transmission equipment, or between the optical fiber access networks and the user cable. Cross-connections and direct connection can be two ways to.
