

OPGW optical cable stranding

Overview

Stranded Layer OPGW (Optical Ground Wire) is a type of composite cable used in overhead power lines, combining the functions of grounding and communication. It integrates optical fibers within a protective stranded layer, providing dual-purpose utility in power transmission and communication. The structural types of OPGW composite ground cable include layer-stranded type and central tube type. The results show that in OPGW cable, if the fiber strand length is less than the maximum lay length, the ultimate tensile stress (UTS) percentage decreases, but if it is equal to or greater than the maximum lay length, it meets worldwide quality standards. Prysmian has a built-in multi-step quality assurance programme, which covers the entire production process from cable design and raw materials purchasing, to final inspection for any single project.
