

Optical Cable Ring Layout

Overview

A fiber optic ring network is a physical or logical network topology where devices (usually switches) are connected in a closed-loop using fiber optic cables. Each node is connected to two other nodes, forming a ring-like structure. This design ensures data can travel in both directions. If one. Fiber optic network design refers to the specialized processes leading to a successful installation and operation of a fiber optic network. It includes first determining the type of communication system (s) which will be carried over the network, the geographic layout (premises, campus, outside. An ADM is a device used in fiber optic rings that allows specific channels (wavelengths) of data to be added or dropped from the ring without affecting other channels.
