

Optical module split into four

Overview

An optical splitter is an essential component used in an FTTH GPON where a single optical input is split into multiple outputs. By dividing a single optical signal from a central Optical Line Terminal (OLT) into multiple outputs for Optical Network Terminals (ONTs) at users' homes, splitters eliminate the need for dedicated fibers to each residence—slashing infrastructure costs while scaling network reach. 1x32 splits were common in North America for G-PON architectures. As XGS-PON continues to be adopted, some service. Traditional ODNs typically adopt a balanced optical splitting scheme, with balanced PLC splitter specifications including 1x4, 1x8, and 1x16. They consist of multiple input and output ends and have. Quad-SFP (QSFP+ and QSFP28) ports allow for four channels of lower-bandwidth communication. 05 introduced this feature for select switches and modules.
