

Photo-hydrogen ionization module

Overview

PHI utilizes a broad-spectrum, high intensity UV light targeted on a hydrated quad-metallic catalyst. The UV light in conjunction with the catalyst promotes the conversion of naturally occurring water vapor into airborne molecules of hydrogen peroxide (H_2O_2). (PHI or Photo-hydro-ionization) is an advanced Indoor Air Quality (IAQ) technology developed by RGF Environmental Group to minimize and neutralize indoor air pollutants such as bacteria, viruses, mold, gases (VOCs) and odors. sitive, rapid, and reliable gas detection is critical. Among the various gas detection technologies available, Photoionization Detectors (PIDs) have carved out an important niche thanks to their exceptional sensitivity ring to chemical manufacturing and emergency response. This product is designed specifically for package systems and utilizes adjustable magnetic feet to. TSI measures Volatile Organic Compounds (VOCs) in air by Photo-Ionization Detection (PID).
