Overview

Level 3 protection is the final barrier of the system, capable of fully eliminating any transient overvoltage that may occur, ensuring the long-term stable operation of sensitive equipment. In lightning protection, the surge protection device in distribution boxes plays a crucial. In a newly constructed residential area, a 10kV power line is introduced into the substation. After stepping down the voltage through the transformer's low-voltage side (0. According to the principle of graded lightning protection, and based on the likelihood of a building being struck by lightning, it is necessary to deploy surge protector against lightning in stages to. Three level distribution: It is the control cabinet of the electrical equipment itself. Comply with the construction department related construction. Electrical equipment is installed under the switch box, forming a three-level distribution. 4kV), power is distributed to a main distribution panel (primary distribution box). When they fail, everything goes dark.
