

Small internal components of the optical module

Overview

They mainly consist of optoelectronic components (such as optical transmitters and receivers), functional circuits, and optical interfaces, aiming to achieve the functionalities of optical-to-electrical and electrical-to-optical signal conversion in optical fiber communication. As an essential component of optical fiber communication, optical modules are optoelectronic devices that facilitate the conversion between optical and electrical signals during the transmission process. Among various optical module form factors, SFP (Small Form-Factor Pluggable). The optical transceiver module is mainly composed of three parts: housing, optical device and integrated circuit board. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside.
