

Splitter network speed attenuation

Overview

A GPON splitter is a passive optical device that takes a single fiber input and splits it into multiple outputs, typically in ratios like 1:2, 1:4, 1:8, 1:16, 1:32, and 1:64. The splitting process introduces signal attenuation, making placement strategy critical for. Gigabit Passive Optical Networks (GPON) have revolutionized fiber-optic broadband by offering high-speed connectivity to multiple users over a single fiber. A key component enabling this efficiency is the optical splitter, which divides the optical signal to serve multiple endpoints. The split ratio and insertion loss are two key parameters defining their performance. One important note is that splitting architectures should be seen as tools that can be mixed and matched to. An Ethernet splitter can drop your network speed from gigabit (1000 Mbps) down to just 100 Mbps. For people with slower internet plans, that might not be a huge deal.
