

# Techniques for splicing fiber optic cables to pigtail sleeves

## Overview

It can be attached to optical fibers by fusion or mechanical splicing. Given the access to a fusion splicer, you can splice the pigtail right onto the cable in a minute or less, which greatly speeds the splicing and saves significant time and cost spent on field termination. A fiber pigtail is a short length of optical fiber that comes with a high-quality, factory-polished connector already installed on one end, leaving a length of exposed glass on the other. --- □□ In. This is where fiber optic cable splicing—the process of creating a permanent, high-performance join between two fiber ends—becomes critical. Another method of connecting optical fibers is termination or connectorization, which consists of processing the end of a fiber optic bundle so that it can be connected to other fibers or devices through fiber optic. Fiber optic pigtail are utilized to terminate fiber optic cables via fusion or mechanical splicing. Fiber optic pigtails are usually found in fiber.
