

Three-level distribution box does not exclude leakage protection

Overview

Three level distribution refers to the general distribution box, distribution box, switch box. In addition to installing leakage protectors in the final switch box, a first level leakage protector should also be installed in the upper level distribution box or main distribution box, forming a two-level protection. "Two-level protection" mainly refers to the use of leakage protection measures, in addition to the final switch box to install leakage protection, but also in the upper level distribution box or general distribution box to install a leakage protection, generally forming two levels of protection. These boxes have inner and outer doors, powder-coated exteriors, and are designed for safety and aesthetic appeal, with rainproof tops for outdoor work. Tertiary distribution boxes, or. May include both fixed and portable boxes, ensuring individual circuit protection to prevent electrical hazards. Built to meet specific safety and.
