

Three-level protection device for main distribution box

Overview

Type 2 SPD is installed at distribution panels and sub-distribution boards, serving as the main protection layer for internal low-voltage systems. Connecting cables that are too long often lead to problems. Adequate system designs allow for the system to withstand and isolate faults while not causing additional damage and/or outages. According to the principle of graded lightning protection, and based on the likelihood of a building being struck by lightning, it is necessary to deploy surge protector against lightning in stages to. Based on extensive research of UK standards, manufacturer specifications, and industry practices, here are practical “rule of thumb” protection device ratings for Type 1, Type 2 and Type 1+2 surge protection devices (SPDs) in main switchboards.
