

UPS cable tray routing process

Overview

Here are simplified general guidelines for cable routing and laying: Group power cables (input, output, battery) together with at least 10 cm clearance between cable groups., UPS paralleling, communication, EPO) to prevent electromagnetic. The cables from the inductor cabinet to the UPS are configured based on the longest cable length before delivery. If shorter cables are needed in the actual installation scenario, you can cut the excess cables and crimp terminals. Cables must be bound to the nearest beam or cable bridge according. Most projects are roughly defined at the start of cable tray design. Upon receipt of the UPS system and accessories at site, necessary precautions shall be taken for unloading, shifting & storage. Q1: What is the primary purpose of cable tray sizing and calculation?

Ensure the total cable area does not exceed the maximum fill area permitted by electrical codes (e. Provide adequate air circulation.
