

What does DSP mean in relay protection

Overview

Thus, various protective devices are used to protect the power system, of which digital signal processor (DSP) numerical relays are capable of significantly improve protection operations. Time-graded protection is implemented using overcurrent relays with either definite time characteristic or inverse time characteristic. The operating time of definite time relays does not depend on the magnitude of the fault current, while the operating time of inverse time relays is shorter the. The objective of relay protection is to quickly isolate a faulty section from both ends so that the rest of the system can function satisfactorily. Long term cost reduction (TCO) for trainings and maintenance by reduce variety of relays A fast and selective arc fault mitigation for air-insulated LV & MV switchgear and Relion protection and control relays and sensor. Protective relays are used in industrial power generation and supply systems to open and isolate branch circuits in the case of excessive current. They are activated by means which are not dependent on a continual AC supply.
