

What does epon fiber distribution box mean

Overview

EPON stand for Ethernet passive optical network. It does this by using Ethernet packets instead of Asynchronous Transfer Mode (ATM) cells. This is what makes EPON different from GPON. As a key player in the FTTH (Fiber to the Home) revolution, EPON enables cost-effective, scalable internet access by leveraging passive. GPON (Gigabit Passive Optical Network) is a fiber-optic access technology widely used by ISPs to deliver high-speed Internet. It uses a point-to-multipoint architecture that allows one optical fiber to serve multiple homes or businesses, with downstream speeds up to 2.5 Gbps and upstream speeds up to 1.25 Gbps. EPON leverages an all-fiber optic transport system and signaling architecture called an optical distribution network or ODN. 99% availability. A fiber distribution box (FDB) is a passive enclosure that provides secure splicing, termination, and distribution of optical fibers. Which One Should You Choose?

If You Want. Both.
