

What does zscT represent for cable trays

Overview

Zero Sequence Current Transformer also known as Core Balance Current Transformer is a type of current transformer in which all three phase conductors are passed through the window of a single CT. These CTs are typically used for ground fault sensing and ground fault protection. The circular through core current transformer is mainly used in the cable circuit environment, which has simple structure, small volume and flexible application. It is also known as: Unlike a conventional CT that measures the load current of a single phase, ZSCT measures the vector sum of all three-phase currents. Cable trays play a vital role in supporting electrical cables and wires in commercial, industrial, and utility installations. For proper installation, design, and maintenance, adherence to international standards is essential. One of the most recognized frameworks globally is the IEC standard for. When developing our cable support OBO can offer reliable solutions for systems, three attributes are at the routing and fastening cables securely core of what we do: efficiency, resilience in the industrial environment.
