

What is the normal dBm value for a 1310nm optical power meter

Overview

The normal value of the optical power meter is 12dbm. The optical power meter is an instrument suitable for measuring the absolute optical power or relative optical power loss through a section of optical fiber. In optical fiber measurement, the optical power meter is a common. Typical power levels measured by an optical power meter: Telecom transmitters: 0 to +10 dBm (1 to 10 milliwatts), Receivers: -30 dBm (1 microwatt) DWDM systems with fiber amplifiers: +10 to +20 dBm (10 to 100 milliwatts), Receivers: -20 to -30 dBm (1-10 microwatt) Data links and LANs: 0 to -10 dBm. The normal value of the optical power meter is 12dbm. The dBm scale is logarithmic, meaning a small numerical change represents a large change in actual light power. This allows engineers to express a huge range of power. 1310nm optical modules are essential for efficient data transmission in fiber optic networks, especially for medium distances.
