

What is the stext interface

Overview

A text user interface (TUI) (also called textual user interface or terminal user interface) is a text-based user interface. TUIs are different from command-line interfaces in that, like GUIs, they use the entire screen area and do not necessarily provide line-by-line output. A lot of us have seen many examples of text user interfaces from a simple text editor, to other programs that use a text user interface to present the user with its functionality. We'll be using many of them as examples in this series. Your smartphone, laptop and desktop computer have user interfaces. The text in the comment is a relatively new addition to the Python ecosystem. It allows you to specify dependencies inline so that tools can setup an environment automatically.
